

# Digit ENTERPRISE™

Fundamentally redefines how organizations access, interact with and exploit digital evidence.

DigIT Enterprise is a leading, intelligent enterprise-wide search application, featuring patent-pending methods designed to find, collect and preserve electronic information for the purpose of delivering secure, defensible, repeatable processes in the management of digital evidence. DigIT Enterprise defines litigation readiness, improves decision making capabilities for early case assessment, eliminates spoliation of evidence and transforms the way organizations solve the business problem of escalating discovery costs.

**Enabling a new level of confidence that you have what you need when you need it**

DigIT Enterprise provides organizations a scaleable, high-performance information retrieval and data acquisition software designed to return instant results against search analytics from keywords to concepts. DigIT enables users to immediately identify custodians of interest, determine how much information each custodian "owns" relevant to the search term as well as where the information resides. Never before has ESI been so easily identified – prior to collection or preservation. Due to the ability to fight technology with technology, software today can easily assist you with meeting deadlines and avoiding sanctions.

**Providing access to a wide variety of file formats and data sources**

Laptops, desktops, Instant Messaging, VOIP, databases, email systems, file servers, foreign languages – all information stored in any form or format is easily accessed using DigIT Enterprise. All requirements are identified during the planning phase prior to implementation which also identifies any customization that may be necessary to return the most effective results for you and your team, making your discovery process automated and repeatable.

**Incorporating scalability and high performance**

DigIT scales easily for enterprise-wide usage. Offering sub-second response times to search queries, DigIT Enterprise consistently operates without performance degradation of the enterprise network or user experience.

**Building upon Microsoft technology builds a level of trust with IT**

Written in .NET 2.0, supported by SQL 2005, and leveraging AJAX technologies, DigIT 2.0 provides leading edge technical solutions to address the ever-challenging issues centered on forensically sound data collection practices within corporate enterprises. The .NET framework includes design features and tools that ensure conformity to

previously installed software and a stringent security model resulting in simplified deployment.

**Searching once means use as often as needed**

Once the searches are completed, the results are exported to the index and the native files are preserved for further review. The exported data can then be saved in a repository by matter, subject, custodian, or label of choice. This fail-safe measure helps harness the power of existing information assets in subsequent matters, rapidly minimizing the total cost of ownership.

**Automating reports to support your process**

The full-bodied report feature within DigIT is customizable and can be set to generate reports automatically. All information for these reports is captured in a log. That data is converted by DigIT to .xml which can be exported to any report writer. These reports are invaluable for counsel who want / need to document how searches were conducted, by whom, at what time, and what specific search terms were used. Additional information is captured to generate Chain of Custody, Good Faith and Exclusion reports. All of this documentation empowers counsel to have available the information necessary to satisfy challenges by opposing counsel or the Courts.

**Making your case**

Fact: cases are won or lost on discovery issues. Fact: statistics show that more time is spent on legal discovery than on any other legal task. Fact: discovery represents 50 percent of litigation costs and up to 90 percent of litigation costs in cases in which discoverable ESI is actively used. Fact: up to 70% of the documents relevant to a case may be contained solely in electronic format. It is today's reality that documents created and stored electronically are critical elements of litigation or internal investigations. In the majority of cases only 3% of the universe of information initially collected for review is tagged as relevant. DigIT helps legal teams get to that 3% successfully, efficiently and cost-effectively.

---

"When talking to clients about e-discovery preparedness, I always mention DigIT as an option for them to consider."

I deem that to be a vital tool to control the rampant costs of e-discovery."
