

# Digit ON DEMAND™

Save time and money. Decide the evidentiary value of electronic data prior to paying for processing and review.

DigIT On Demand is a hosted version of DigIT Enterprise featuring patent-pending methods designed to search, cull and export collected electronic data for the purpose of reducing the amount of information requiring further processing and review. DigIT On Demand improves decision making capabilities for early case assessment, eliminates unnecessary processing cost and transforms the way organizations solve the business problem of escalating discovery costs.

#### **Determining what is relevant before incurring the cost of processing and review**

DigIT On Demand is a web-based application designed to enable users to search electronic data for the purpose of determining what is or is not relevant to a case, prior to sending the entire collection for processing and review. This permits legal teams to better understand their digital evidence early in the life of a case, presenting an opportunity to decide how to proceed without being exposed to unnecessary expense.

#### **Providing access to a wide variety of file formats and data types**

Lotus Notes, MSExchange, Instant Messaging, VOIP, databases, spreadsheets, foreign languages – all digital information stored in any format is easily searched using DigIT On Demand. Queries can be constructed using keywords, standard Boolean search parameters, or at a more granular level through searching metadata (created date, modified date, last accessed) and fields such as title, subject and custodian.

#### **Incorporating scalability and high performance**

DigIT On Demand scales easily based upon the amount of data to be searched and exported as well as the time-frame / deadlines in place. Offering sub-second response times to search queries, DigIT On Demand consistently operates without performance degradation regardless of file types and size of files being retrieved.

#### **Building upon Microsoft technology builds a level of trust in performance**

Written in .NET 2.0, supported by SQL 2005, leveraging AJAX technologies and incorporating patent-pending processes designed for managing evidentiary data, DigIT On Demand provides leading edge technical solutions to address the ever-challenging issues centered on forensically sound data search and export.

#### **Offering professional services for neutral third party validation of the process**

Some clients prefer to retain the services of an expert third-party to ensure data integrity and defensibility and minimize evidentiary issues or provide expert testimony. The Professional Services Team at DigIT Technologies has the experience needed to perform searches based on client-provided criteria and offer testimony backed by system-generated reports when necessary.

#### **Automating reports to support your process**

The same full-bodied report feature within DigIT Enterprise is available with DigIT On Demand. All information needed to generate these reports is captured in a log then converted to .xml which can be exported to any report writer. These reports are invaluable for Counsel who want / need to document how searches were conducted, by whom, at what time, and what specific search terms were used. Additional information is captured to generate Chain of Custody, Good Faith and Exclusion reports. All of this documentation empowers counsel to have available the information necessary to satisfy challenges by Opposing Counsel or the Courts.

#### **Making your case**

Fact: cases are won or lost on discovery issues. Fact: statistics show that more time is spent on legal discovery than on any other legal task. Fact: discovery represents 50 percent of litigation costs and up to 90 percent of litigation costs in cases in which discoverable ESI is actively used. Fact: up to 70% of the documents relevant to a case may be contained solely in electronic format. It is today's reality that documents created and stored electronically are critical elements of litigation or internal investigations. In the majority of cases only 3% of the universe of information initially collected for review is tagged as relevant. DigIT On Demand helps legal teams get to that 3% successfully, efficiently and cost-effectively.

---

A Fortune 100 client's legal team involved in a government investigation was handed a collection of electronic evidence that exceeded 500 gigabytes.

Faced with a short timeframe and a cost of one million dollars for processing and review of the data set, they selected DigIT On Demand to reduce the data to what was potentially relevant to the investigation.

Once the searching and filtering was complete the amount exported for review was less than 7 percent of the 500 gigabytes. Their savings in processing and review costs exceeded \$850,000. They also gained two much needed weeks of time.
